ACKNOWLEDGMENT

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida as shown in this summary and corresponding data for other citrus states are official estimates of the USDA, National Agricultural Statistics Service. Canned and frozen pack statistics were compiled by the Florida Citrus Processors Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetables, Florida Department of Agriculture and Consumer Services, were used in preparing production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, processors, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

This report was assembled under the direction of Jeffrey K. Geuder, Robert R. Terry, Candice T. Erick, and Rhonda L. Johnson of the Florida Agricultural Statistics Service.

1996-97 SEASON HIGHLIGHTS

PRODUCTION

Citrus production in Florida was up 11 percent over the previous season with a total of 295,315,000 boxes. Production increased for all fruit types except seedy grapefruit and K-Early Citrus. Navel, early-midseason, Valencia, and total oranges reached record levels. Colored seedless and all grapefruit set new records even though grapefruit figures exclude economic abandonment of 3.0 million boxes each of white and colored seedless. Two newer tangerine varieties, Sunburst and Fallglo, have steadily increased production while Dancy declined.

Temple production matched the average of the six prior seasons. The tangelo crop was 61 percent larger than in 1995-96 and the largest since 1987-88. Lime production increased for the third consecutive season but is less than one-fourth of the pre-hurricane 10 season average. Harvested lemons were up 18 percent.

Fruit set of the Robinson tangerine variety rebounded and fresh shipments were 8 percent larger. Shipments of Fallglo tangerines were up 48 percent over the initial recorded season. Sunburst tangerines accounted for over one-half of the tangerines shipped. Dancy shipments were the smallest since record keeping began in 1919-20 and only one percent of the total. Honey tangerine production was up 13 percent and, for the first time since the 1989-90 freeze season, over 40 percent was processed for juice.

The Florida Citrus Processors Association reported final FCOJ yields of 1.57174 gallons of concentrate per box for all oranges and 1.52360 for early-midseason oranges, second only to the record highs of 1.57893 for all oranges and 1.52480 for early-midseason fruit recorded in 1992-93. The late (Valencia) portion of the crop had a final yield of 1.67701, higher than the three previous seasons and third highest on record. The Valencia record of 1.69608 was attained in 1991-92.

California's orange production was up 17 percent over the previous season. The 68.0 million box crop was the largest since 1989-90. Grapefruit production showed a 100,000 box increase. The tangerine crop matched the 1995-96 harvest. Although the lemon crop was down nearly five percent, it accounted for 88 percent of the U.S. total.

Arizona's citrus production, totaling 5.05 million boxes, was down 44 percent from the 8.95 million boxes harvested in 1995-96. Bearing acreage decreased again for lemons and tangerines while orange and grapefruit bearing acreage decreased for the third consecutive season. Yield per acre reductions reflect alternate bearing patterns.

The Texas orange crop, up 51 percent from the previous season at 1,420,000 boxes, was the largest since the December 1989 freeze. Grapefruit bearing acreage was up 15 percent, and the resulting crop of 5.3 million boxes was the largest crop since 1982-83.

CITRUS BOX WEIGHTS: Approximate net weight in pounds by fruit type and states

States	Oranges	Grape-fruit	Tan-ger-in-es	Lemons	Limes
FL	90 ¹¹	85	95	90	88
CA	75	67	75	76	--
TX	85	80	--	--	--
AZ	75	67	75	76	--

¹¹ Includes Temples and tangelos at 90 pounds.

VALUE

The preliminary on-tree value of the crop exceeded \$1.0 billion for the sixth time in 10 seasons. Although the \$1.0 billion value of the 1996-97 citrus crop is 11 percent lower than the 1995-96 value, revised upward two percent, it is greater than the three prior seasons. Revised estimates for packing and pick and haul charges resulted in a five percent increase to the value of the 1994-95 crop.

Preliminary value is based on that part of the crop priced at harvest, which accounts for all of the fresh fruit and about 40 percent of the processed. When all participation plans and cooperative pools are finalized, a revised value will be calculated.

Despite the record supply and lower prices for orange varieties, the early-midseason crop showed a slightly higher value. Early-midseason oranges (excluding Navels) were \$3.58 per box, down seven percent, and Navels, which accounted for 60 percent of early-midseason fresh use, were down 20 percent at \$3.90. Valencias returned \$4.26, down 27 percent. The weighted orange price of \$3.87 reflects a 17 percent decrease and the resulting value of \$876,042,000 for all oranges was down eight percent.

Grapefruit varieties suffered price decreases of 82 percent for seedy, 59 percent for white seedless, and 27 percent for colored seedless. The \$68,436,000 value of the crop is the lowest since 1969-70.

Lower prices and values were recorded for Temples, K-Early Citrus, and limes. Despite a lower price, the tangelo value was up slightly. A higher lemon price coupled with increased production raised the value of the crop 45 percent. Reported prices and values were down for all tangerine varieties except Fallglo. The price of honey tangerines fell to \$12.03.

The season average delivered-in price of fruit going into FCOJ reported by the Florida Citrus Processors Association was \$5.52 per box or 88¢ per pound of solids. Early-mids averaged \$5.33 per box or 88¢ per pound of solids, and late oranges averaged \$5.96 per box or 89¢ per pound. Prices for fruit used in FCGJ averaged \$1.63 per box or 36¢ per pound for white seedless and \$1.30 per box or 29¢ per pound of solids for colored seedless grapefruit.

FLORIDA, ALL CITRUS: Value of sales on-tree, crop years 1987-88 through 1996-97

¹¹ Revised. ²² Preliminary.

FOREIGN EXPORTS

Fresh fruit exports totaled 27.9 million 4/5 bushel cartons, up slightly from last season. Canada accounts for the most receipts of Florida oranges and specialty fruit while Japan receives the most grapefruit.

A total of 22.4 million gallons of FCOJ were exported, mostly to Canada. There were also 4.9 million gallons of FCGJ exported.

1996-97 FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS, AND MONTHS

Heavy rains preceded freezing temperatures January 8, 1996. Excellent moisture conditions may have played a major role in minimizing fruit loss. Following the cold weather of February, warm temperatures and adequate moisture provided excellent growing conditions for new growth and bloom buds. Full open bloom occurred in the latter half of March resulting in a very good fruit set. Moisture was adequate with regular rains in all areas.

Groves were in very good to excellent condition during the Spring. Irrigation was used in April to insure adequate moisture and continued into a dry and windy May. By the first of June, summer rains had started and trees looked very good. Shedding of excessive, unwanted fruit had stopped. Most of the summer was hot and wet with short periods of dry weather. There was an abundance of new foliage on trees of all ages due to the excellent growing conditions. Fruit sized well and dropage was minimal.

Harvest of the 1996-97 crop began the second week of September with limited supplies going to market. Rains were generally normal in most areas producing the last flush of new growth for the year. Groves, trees, and new crop fruit were in very good to excellent condition. The high temperatures during the month caused some caretakers to run their low volume irrigation to ensure good tree and fruit condition.

October was much wetter than normal and feeder bands from Hurricane Lili supplied the southern areas of the citrus belt with more rain than they wanted. Groves in the upper interior were spared from unwanted additional moisture. The abundant rainfall during the month produced new foliage on trees of all ages. Harvest gained momentum this month with large quantities of oranges for processing. The fresh fruit houses were also very active shipping specialty fruit.

Most of November was seasonally dry with growers running their irrigation equipment to maintain good tree

condition. The shorter days, cool temperatures, and absence of regular rainfall all but stopped new growth on most trees.

The first of December was dry and cool with a few light showers preceding the cool fronts. Temperatures in the upper thirties, common on the 8th and 20th of the month, were beneficial to growers as they placed most trees in a quasi-dormant condition making them less susceptible to possible freezing conditions.

The weather during early January 1997 was warm and dry with rain coming only a few days before the freezing temperatures on the morning of the 19th. The western and southwestern parts of the citrus belt received the lowest temperatures with some trees showing varying degrees of defoliation. Although some tree damage occurred in colder locations, use of watering systems generally prevented major cold damage.

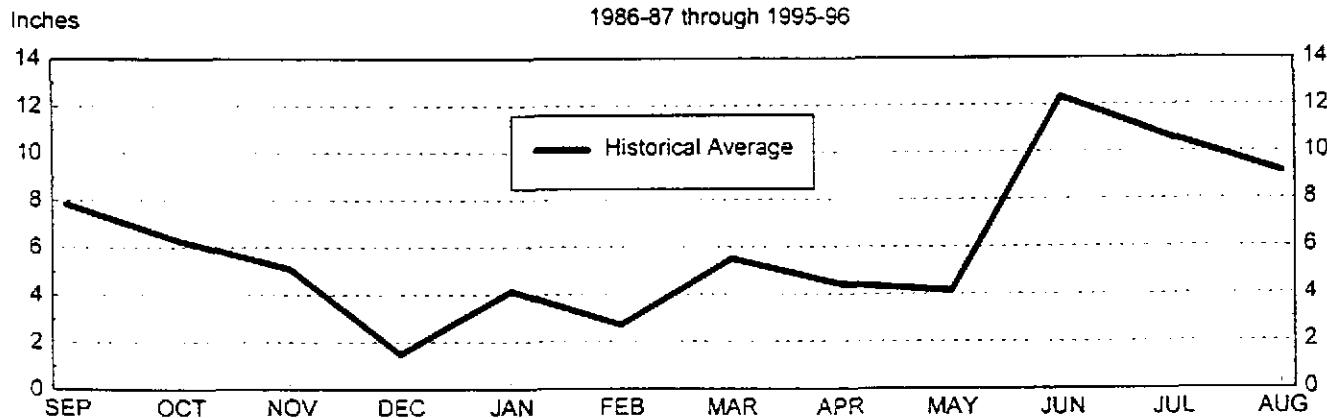

Warm temperatures and very little rain were the rule through February and until mid-March when scattered rains started falling to help advance the normal bloom period.

April was wetter than usual enhancing tree condition and an abundant fruit set. Most of May was hot and dry. Growers and caretakers were irrigating to maintain good tree and fruit condition.

Summer rains were welcomed in June. Groves, trees, and new crop fruit were all in very good to excellent condition by mid-summer. August was a very wet month with some caretakers ditching to move excessive and standing water.

Charted below is the historical average of monthly rainfall which includes data from two stations in each of the citrus producing areas. The ten stations are: Arcadia, Avon Park, Clermont, Clewiston (AG), Immokalee, Lake Alfred, Orlando, Plant City, Stuart, and Vero Beach (4W).

FLORIDA PRECIPITATION: Average monthly rainfall, ten selected stations,

PRICES

All prices reported in this publication are on-tree prices representing the average price received by growers for their fruit. The term "on-tree" relates to fruit returns to the grower after the costs of picking, hauling, and packing have been removed. Prices are based on records of commercial fresh fruit sales and processed fruit returns.

Each season, beginning with the first month that three percent of a fruit type is harvested, monthly estimates are computed. Reports from fresh fruit sales organizations and from packers provide data for an average f.o.b. price. Processors report an average spot and cash price for fruit delivered to their plants. From these values, an estimated charge for picking, hauling, and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales.

At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price. A year later, after most processed products are sold, cooperatives and firms with participation plans report prices of fruit they handled. These prices, combined with the spot and cash prices collected earlier, are weighted together by varieties to determine the final processing price received by growers. From this price, charges for picking, hauling, and packing, as estimated by University of Florida economists, are deducted to arrive at the final on-tree price received by growers. These preliminary figures for the season just ended, the revised figures for the previous season, and county production by type are released annually in late September.

COUNTY PRODUCTION

Estimates of citrus production by counties were prepared using objective survey data obtained from the citrus crop estimates program. Production for Florida has been distributed to counties based on the biennial citrus tree census, limb count survey data adjusted for dropage to end of season, and size data at maturity.

Tree numbers by county which are used in the estimates were obtained from the latest tree census. Productivity per tree is obtained from several objective fruit surveys including limb count, size, and dropage. Because of the statistical sampling design, counties with higher production in general have a greater number of samples and, therefore, estimates for these counties can be considered more reliable. Thus, for the same reason, estimates for the production areas are more reliable than for the individual counties.

TREE CENSUS

The Florida Agricultural Statistics Service first indexed the State's commercial citrus groves on aerial photography as of January 1966. Ground crews identify all the State's groves by fruit type, row spacing, and year in which set. Photo interpreters in the Orlando office then delineate the groves by variety blocks on photo transparencies at a scale of 1 inch to 660 feet. Variety blocks are measured with planimeters to obtain acreage and then indexed by land section.

The design of the inventory survey allows for quick and economical updating. Since 1966, the citrus belt has been resurveyed each second winter to determine changes. Photographing begins in November when weather conditions are most favorable and is generally completed in 30 to 90 days. The same three-mile-wide flight lines established in 1966 are photographed on each succeeding flight. Approximately 14,000 square miles of photography are obtained at a 1 to 30,000 scale.

The last statewide survey was conducted as of January 1996. Through 1995, all types of citrus planted totaled 857,687 acres, up 0.5 percent from the 853,742 acres recorded in January 1994. Acreage declined in 15 of the 35 citrus counties since the previous census, but the Gulf Citrus area showed a slight acreage gain. For the second consecutive census, the number of trees planted is a record. The rate of new plantings slowed in 1994 and 1995, with only 11 percent of the 107.1 million trees classified as non-bearing.

Photographing for the next survey began in November 1997, and field work will update the acreage records as of January 1998.

FLORIDA, ALL CITRUS: Acres in commercial groves

HISTORY OF FLORIDA'S CITRUS INDUSTRY

The citrus tree is a native of the Orient. From there it was carried ever westward by man, to India, to the Mediterranean, and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were grown in abundance around St. Augustine at that time.

Early settlers in Florida some two centuries later found wild citrus trees scattered over the State. One of the oldest cultivated groves planted in Florida (Hume, 1926 p.95) is thought to have been the Don Phillippe grove in Pinellas County, planted sometime between 1809 and 1820. Nearly 1.5 million boxes were shipped in 1887-88, the first season on record. Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. In 1996-97, Florida produced a record 295.3 million boxes representing 76 percent of the Nation's production.

BOXES OF FRUIT PER TREE

The Florida Agricultural Statistics Service conducts objective surveys to determine fruit per tree, average sizes, and droppage between August and maturity. These data are used to estimate production per tree for each of four types of citrus fruit, as shown in the following tables.

The estimates of production per tree are based on official end-of-season production estimates and the number of bearing trees indicated by the citrus tree inventory surveys. The averages

of boxes per tree for age groups shown are calculated from estimates of fruit per tree in August, size at maturity, and drop between August and maturity.

Additionally, the boxes are subdivided by the Indian River Marketing District versus the remainder of the State. The estimated boxes by types and age groups are weighted averages of the indicated seasons.

¹¹ Forecast. ^{2/} Crop years refers to harvest and marketing period, which usually begins in the fall and extends to the spring. This corresponds roughly to October-June in the Northern Hemisphere and April-December in the Southern Hemisphere. For the Southern Hemisphere, harvest occurs almost entirely during the second year shown. The harvest of lemons usually begins earlier and often extends throughout the year. ^{3/} One metric ton is equivalent to 2,204.6 pounds. ^{4/} Includes Tempties, called mandarin or unshu mikan, but also including mandarin hybrids. ^{5/} Mainly satsumas (also for over one-half of Brazil's production. About 120,000 tons of tangerines, which are processed, are included in the orange table. ^{6/} Includes tangelos, which account for about half of the combined tangerine and tangelo production. ^{10/} Clementines only. ^{11/} State of Sao Paulo only.
